Figure 10A-G. Modern environmental setting and sand volume behavior by littoral cell, observed from beach profiles. (A) Kaimana Beach: Kapua Channel is an avenue for cross-shore transport. Net longshore transport is to the north, with accretion adjacent to the Natatorium at profile 3. (B) Queens Beach: Net longshore transport is to the north. Interruption of longshore currents by the Queens groyne during high wave events can create an offshore rip, responsible for sand loss from the littoral cell. (C) Kapiolani Beach: Profile data indicate a stable setting. Interruption of longshore currents by the

Barge Mounted Hydraulic Pump System

Typical Section for Pipeline

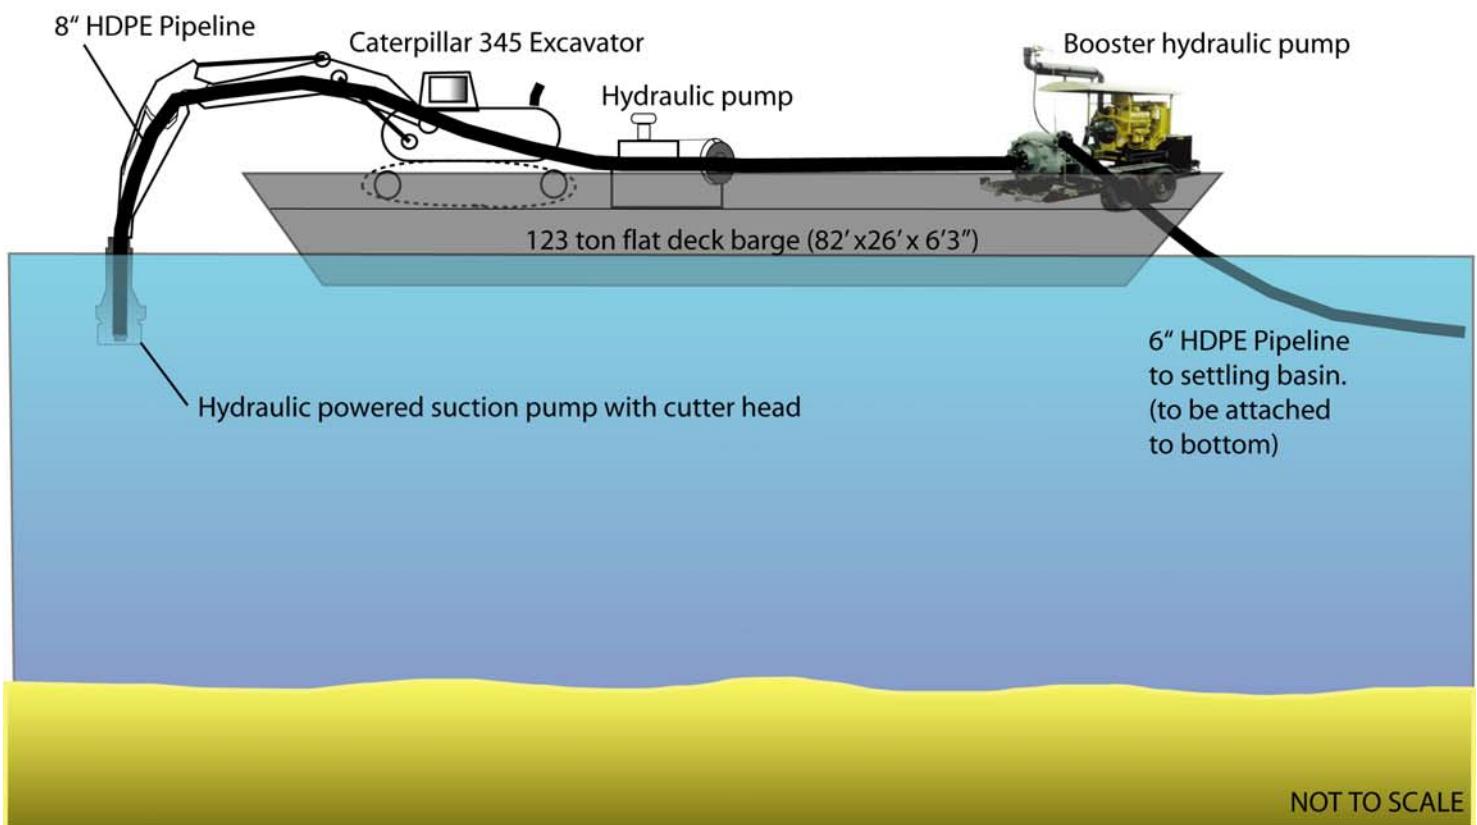

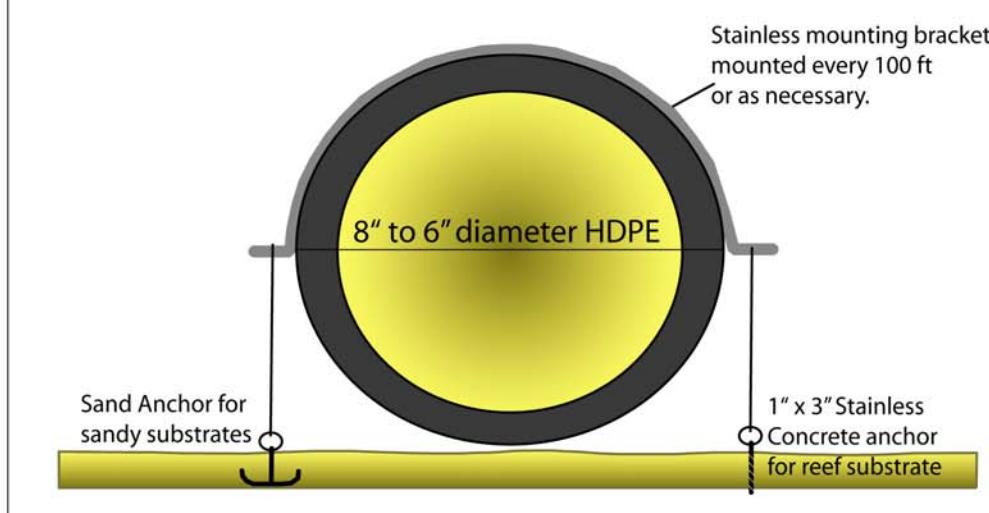

Figure 17. Proposed Barge and Excavator Pump System.

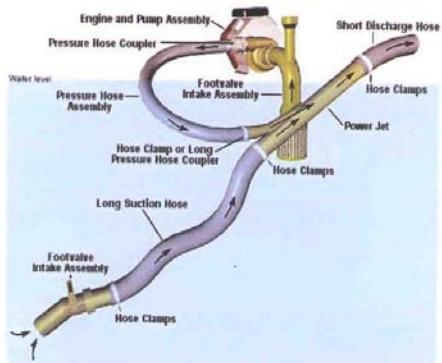

SIX INCH JET RECLAMATION DREDGING SYSTEM

Keene's 6 inch Gravel Pump Reclamation Systems are designed to pump gravel 2000 feet away or lift material as high as 100 feet. These systems are designed for larger projects requiring higher yardage output, longer discharge lengths and higher head capacities. Gravel Pump Reclamation Systems employ vortex style pumps from 2 to 6 inches in diameter that are specifically capable of dealing with gravel and other hard materials. These pumps are constructed of hard alloy steel materials for optimum performance and superior longevity.

A sample of a 6" reclamation dredge pump:

Booster Pump System

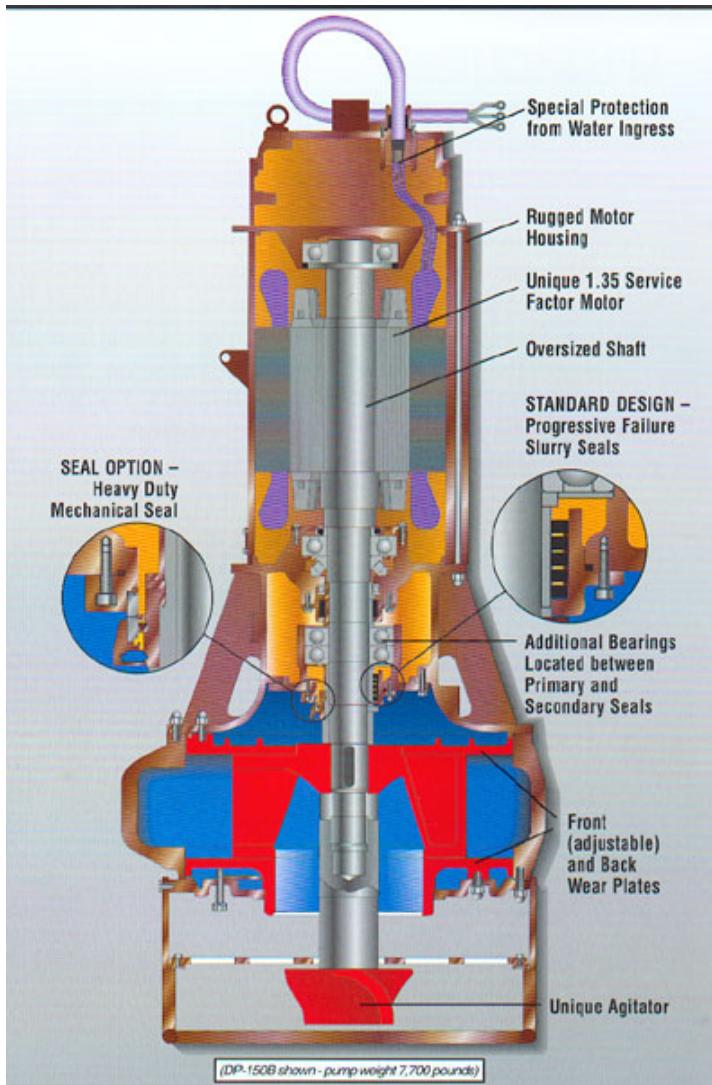

Figure 18. Proposed Hydraulic Pump system.

Settling Basin Profile Kuhio Beach

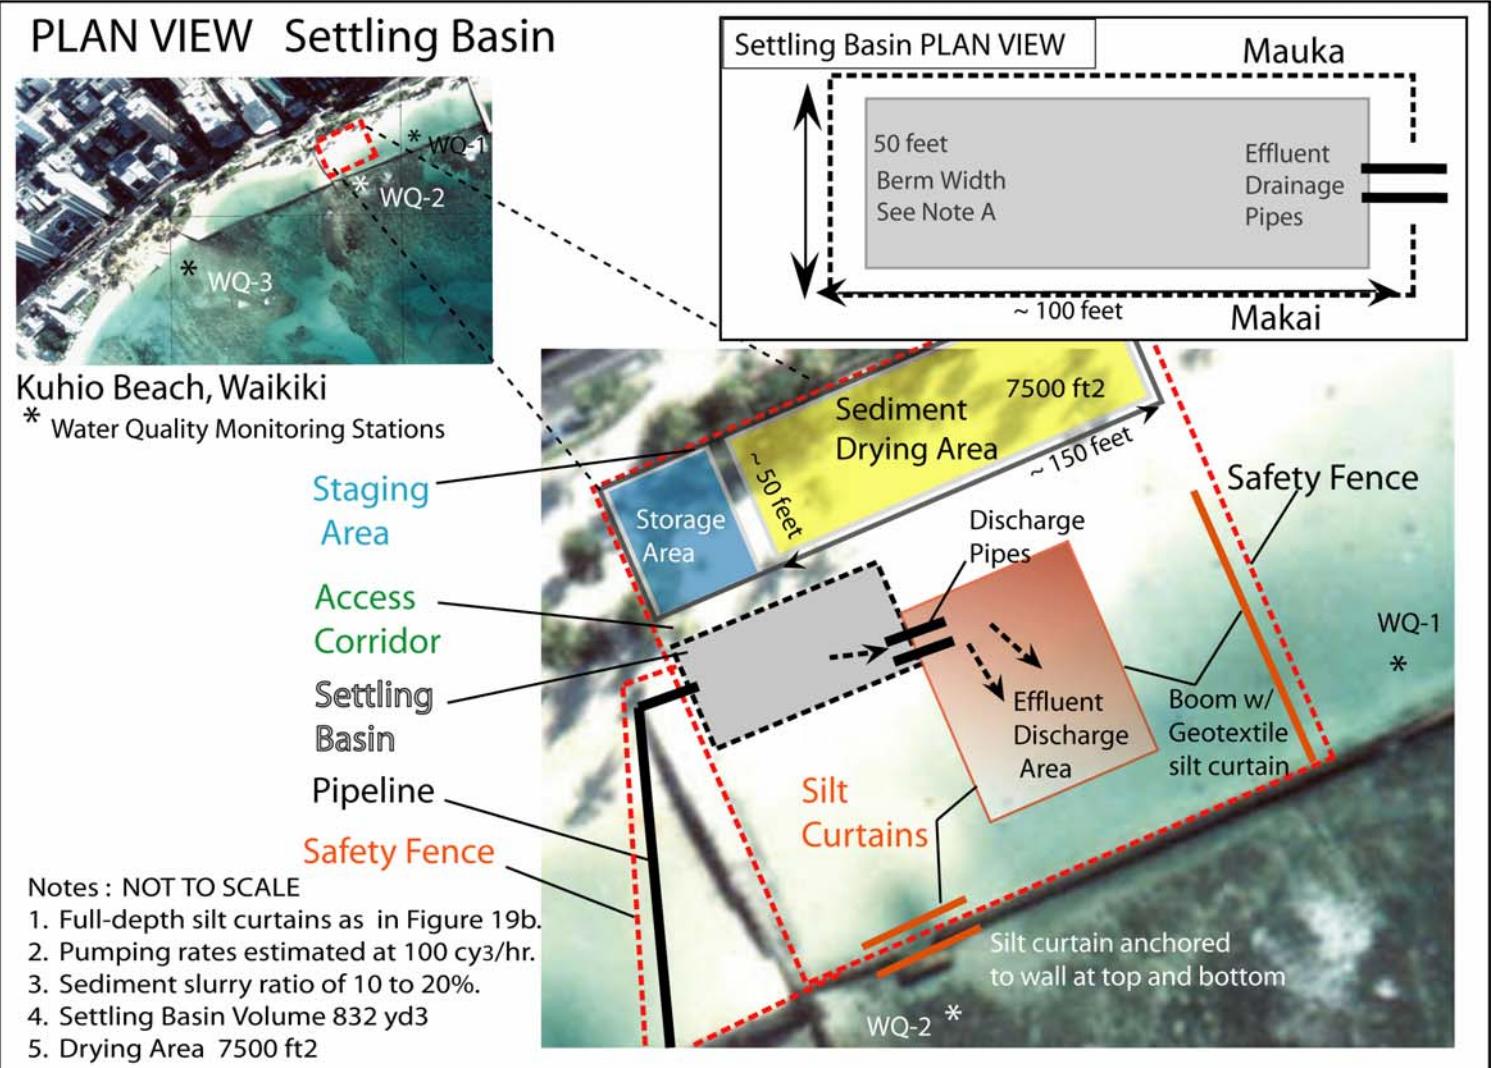

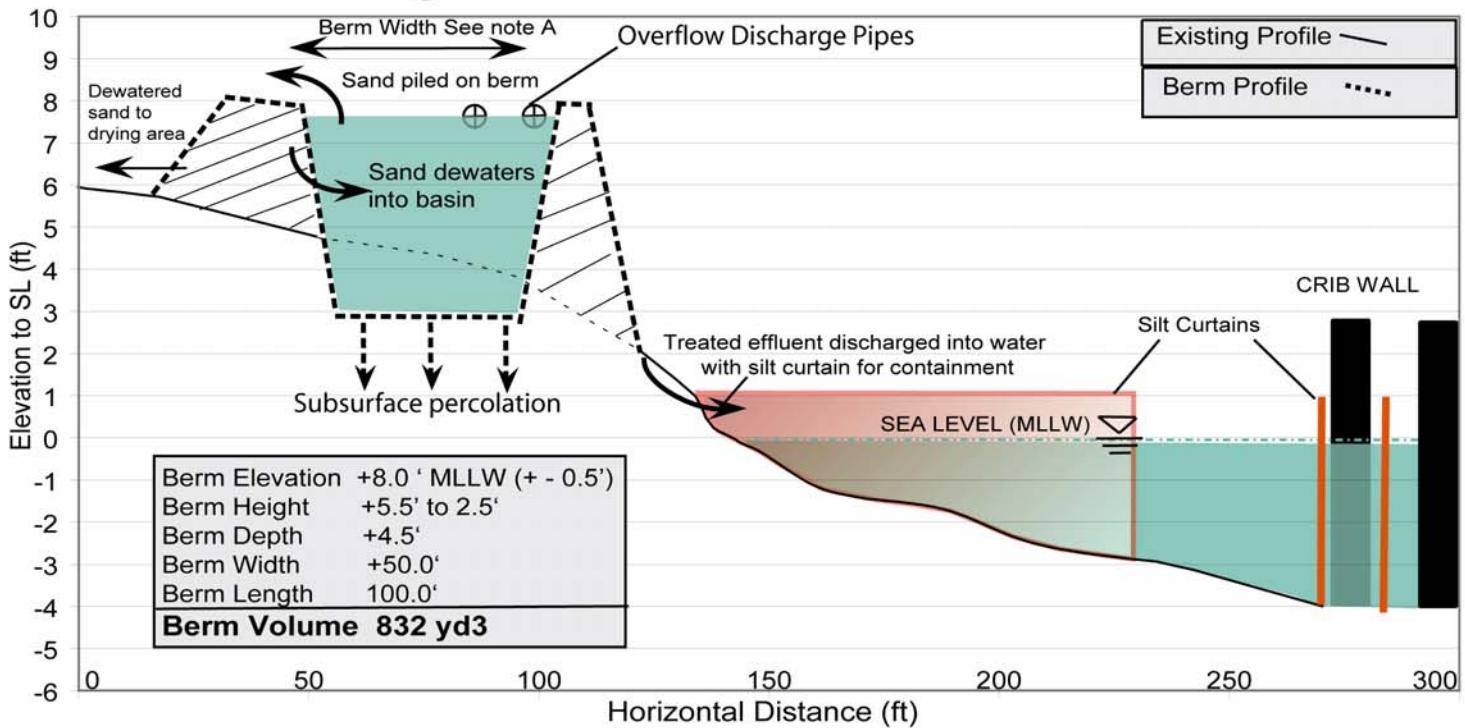

Figure 19. Proposed Settling Basin Design.

Lightweight Turbidity Curtain

Application: Calm waters with little current, such as lakes, ponds, canals and shoreline areas.

Specifications

- Fabric - Polyester reinforced vinyl high visibility yellow
- Connector - Sections are laced together through grommets and load lines are bolted together.
- Flotation - 6" expanded polystyrene over 9 lbs./ft. buoyancy.
- Ballast - 1/4" galvanized chain (.7 lbs/ft).
